

1 ABSTRACT

2 An identification system including at least one transmitter configured to transmit  
3 a signal comprising an associated identification code. A receiver is configured to  
4 receive the signal and establish a comparison indication based on comparison of the  
5 identification code with a reference code. The comparison indication is positive if the  
6 identification code matches the reference code. A method of transmitting an  
7 identification code, receiving the identification code, and comparing it to a reference  
8 code is also provided.
